

# Premier Product Placement

## Intraoral Camera / Intraoral Digital Cameras

Intraoral Cameras: The biggest hurdle for your patients to accept treatment is that they often do not understand their condition. With an intraoral digital camera, patient education is simplified by being able to help the patient see what you see. Newer intraoral cameras have docking stations or USB connections, making them portable and easy to link to your existing network. With bright LED or halogen light sources, these intraoral digital cameras also allow to visualize more, helping you diagnose fractures the naked eye would never have seen.
